- Next steps?
Who is ASCC?

Enhancing the Capabilities of Those Who Build with Concrete
ASCC Strategic Goals and Actions

- ASCC is an extremely safety centered trade association.
- First concrete trade association with a dedicated full-time director of safety services.
- The Safety and Risk Management Council, a safety council comprised of 18-member company representatives meet monthly to develop and implement safety resources and initiatives for the association.
- Strategic goal for the SRMC- Be an industry influencer by challenging and disrupting traditional safety models.
- ASCC Strategic Goal adopted in February of 2020- H2H initiative, Influence members to transition from traditional hardhat to helmet head protection.
This Initiative Hits Close to Home
Traumatic Brain Injury

- CDC defines TBI as:
  - Blow or jolt to the head or penetrating head injury that disrupts the normal function of the brain
  - Ranges from “mild” i.e., a brief change in mental status or consciousness to “severe” i.e., an extended period of unconsciousness or amnesia after the injury. Potentially fatal.

TBI claims average $135,000
LTA claims average $50,000
From 2003 to 2010, 2,210 fatal TBIs occurred in construction at a rate of 2.6 per 100,000 FTE workers.

NIOSH: Construction workers at high risk for traumatic brain injuries

March 29, 2016

Morgantown, WV – Construction workers sustain more traumatic brain injuries than any other type of workplace in the United States, according to a recent report from NIOSH.

Safety interventions must be emphasized in the construction industry, in which more than 41 workers died of a traumatic brain injury from 2003 to 2010, researchers said.

Traumatic brain injuries represented one-quarter of all construction fatalities during the study period, according to the report. More than half of fatal work-related traumatic brain injuries result of falls – particularly from roofs, ladders and scaffolds. Workers 65 and older are more likely to sustain a fatal traumatic brain injury than workers 25 to 34 years old. Workers at organizations with fewer than 20 employees were more than 2.5 times more likely to sustain a traumatic brain injury than those who worked for organizations with more than 50 employees.

Srinivas Konda addressed the findings in a March 21 NIOSH blog post. Konda is an associate service fellow in the NIOSH Division of Safety Research.
Isn’t There Something Better?
Hard Hats to Helmets

Why should we make the change?

Hard Hat History
Looking At The Past

1919
Bullard for mining and then Navy ship building. Made from steamed canvas, leather brim, black paint and glue

1930’s
Hard hats evolved and were made from metals

1940’s
MSA Skullguard fiberglass
In 1961, the Topgard® Helmet was introduced, which was the first polycarbonate hardhat. Polycarbonate is an extremely durable plastic that is very difficult to crack or break. A year later in 1962, the V-Gard® Helmet launched. Today, both helmets are part of the family of “best-selling helmets.”
OSHA Requirements

**In Short:** Provide ANSI Z89.1 OR Prove Equivalent effectiveness

1926.1030(a)

Employees working in areas where there is a possible danger of head injury from impact, or from falling or flying objects, or from electrical shock and burns, shall be protected by protective helmets.

1926.1030(b)(1)

The employer must provide each employee with head protection that meets the specifications contained in any of the following consensus standards:

1926.1030(b)(1)(i)

1926.1030(b)(1)(ii)

1926.1030(b)(1)(iii)

1926.1030(b)(3)

The employer must ensure that the head protection provided for each employee exposed to high-voltage electric shock and burns also meets the specifications contained in Section 9.7 ("Electrical Insulation") of any of the consensus standards identified in paragraph (b)(1) of this section.

1926.1030(b)(3)

OSHA will deem any head protection device that the employer demonstrates is at least as effective as a head protection device constructed in accordance with one of the consensus standards identified in paragraph (b)(1) of this section to be in compliance with the requirements of this section.

[77 FR 37600, June 22, 2012; 77 FR 42988, July 23, 2012]
What technical and performance standards do helmets meet?
Head Protection Safety Standards Worldwide

EUROPE
EN 397 / EN 12492 / EN 14052

USA / CANADA
ANSI Z89.1 / CSA Z94.1

AUSTRALIA / NZ
AS/NZS 1801
ANSI Z89.1 TYPE I and TYPE II

- **ANSI Z89.1 TYPE I** helmets are tested for:
  - Top impact absorption
  - Penetration resistance
  - Flame resistance
  - Electrical classification requirements (Conductive, General, Electrical)

- **ANSI Z89.1 TYPE II** helmets pass Type I tests and additional tests for:
  - Lateral impact
  - Lateral penetration
  - Chin strap requirements (if applicable*), and
  - Low/high temperature operating range

* It is important to note that an ANSI Type II helmet can be sold without a chin strap. A chin strap could be added as an accessory after purchase and not be subjected to any testing.
Breakdown Of The NIOSH Study

- 1269 (57%) Fatalities from FALLS!
  - 388 (24%) fell from roofs
  - 301 (24%) fell from ladders
  - 212 (17%) fell from scaffolds/staging
  - 25 employees fell and died from the same walking/working surface
  - Small contractors(<20), foreign born, older workers > risk
Helmet Design and Testing
Expanded Polystyrene (EPS)

- First Law of thermodynamics (Law of Conservation of Energy) states that energy can neither be created nor destroyed; energy can only be transferred or changed from one form to another.

- Energy from impact involving EPS is absorbed during the crushing of foam creating heat and limiting energy from reaching the head/brain.
Helmet Testing

Force Transmission

Apex Penetration

Impact Attenuation
Helmet Effectiveness

- Evaluation of the Fall Protection of Type I Industrial Helmets
  - Without a hard hat or helmet – 100% probability of serious head injury
  - With a traditional hard hat ~ 65% probability of a serious head injury
  - With a helmet ~ 25% probability of a serious head injury

- Note: In the automotive industry < 50% is the generally accepted permissible limit

# Hard Hat vs. Safety Helmet

## HARD HAT
- Standard hard hats are 60-year-old technology
- Complying with ANSI Z89.1 (top impact and top penetration)
- When falling, a hard hat will fall off your head.
- **Designed just for falling objects**
- **5 years shelf life**
- No chinstrap and no additional lining
- Overall fit hinders movements
- Few and limited accessories
- Warranty: 1 year

## SAFETY HELMET
- EPS foam all over the shell absorbs and dissipates the impact
- **Complying with ANSI Z89.1/2015** (top impact and top penetration) **AND additional side, rear and front impact** according to mountaineering standard EN 12492 or ANSI TYPE II (with strap)
- Stays on your head during a slip, trip, or fall.
- **Designed for Fall Protection & Heavy Impact**
- **10 years shelf life**
- Wide collection of accessories
- Warranty: 3-5 years
Hard Hats to Helmets

Why should I make the change?
Our Call to Action
Safety Helmet Initiative: Objectives

For **ASCC, Structural** and for our Industry:

- This is about **saving lives**.
- We’re trying to connect all the different pieces of a solution to provide the industry a **much better** solution.
- We want to share our vision, and hope you feel passionate about being part of this.
Safety Helmet Initiative: Objectives

1. **Ensure a significantly lower cost solution available in the U.S. Market.**
   - Meets ANSI Type I requirements
   - Meets performance requirements of EN 12492, ANSI Type II
   - $30-$40 target - Current market range $60-$100+

2. **Start saving lives**: Work with manufacturers to ensure there is supply to all interested parties. Target industry organizations, industrial clients, and major general contractors to create a trickle-down affect to their specialty contractors.

3. **Lobby for Change**: With lower cost solutions, we can push for change to Standards and OSHA requirements without a negative impact to the industry.

4. **Watch the Market Adapt**: With growing interest and changing requirements, other manufacturers will bring solutions to the table. Product innovation and cost reduction will follow.
What about comfort, maintenance and accessories for the helmets?
Helmet Accessories

- Bracket and visors
- Ear muffs
- Straps and clips for headlamps
- Reflective Strips
- Winter padding
- Neck shade
Helmet comfort and fit

Weight – hard hat 14 oz ~400 grams
Helmets ~450-500 grams

“I love it! It’s much more comfortable than the old hard hat” – Dave

“It feels a lot lighter on your head” – Steve

“The upgraded suspension really feels secure, and I really like how it adjusts to my head” – Ross
Aren’t helmets hotter than hard hats?
Head Protection Temperature Study

Georgia Tech Enterprise Innovation Institute: Safety, Health and Environmental Services Group

- **Testing Protocol**
  - Six Quest Temp 34 Heat Stress monitors (WBGT)
  - Six different head protection models
    - 4 helmets
    - 2 hard hats
    - Sponge saturated with 50 mL of water to simulate perspiration and water loss was measured at the end of each testing cycle.
  - Internal and external temp. measured over 3 day period
Head Protection Temperature Study

New Technology
MIPS Technology

- **Multi-Directional Impact Protection System**
  - Reduces rotational forces caused by angled impacts to the head.
  - A helmet’s shell and liner are separated by a low friction layer which allows the helmet to slide, noticeably reducing trauma to the brain in the case of oblique impacts.
  - MIPS layer is located between the liner and the user’s head.
Energy Absorbing Cell Technology

- A collapsible cellular structure that lines the inside of a helmet.
- It works like a crumple zone that absorbs the force of an impact before it reaches your head.

How it works
In order to protect your head and absorb the energy created by an impact, WaveCel goes through a three-step change in material structure.

- **Flex**: First, the cells flex to reduce the initial frictional forces.
- **Crumple**: Next, the cells crumple like a car bumper upon impact.
- **Glide**: Finally, WaveCel glides to redirect energy away from your head.

Hardhats to Helmets

Traumatic Brain Injuries are responsible for 25% of all construction fatalities, and many life-altering injuries.

MAKE THE TRANSITION

www.hardhatstohelmets.org
Helmets work!
Case Study
This Statement of Support relative to the change from the traditional hard hat to impact and penetration resistant helmets is made and entered into by and among the Construction Contractors signed below.

Statement

The future of the United States construction industry depends on nurturing the development of a safe and healthy environment for over 7,200,000 workers; and

NIOSH has found that the greatest number of fatal and non-fatal traumatic brain injuries (TBIs) occur in the construction industry; and

Research reveals that helmets provide significantly improved protection against TBIs than the traditional construction hard hat; and

Industry leaders, including construction business owners, general contractors, trade partners, material providers, trade associations, heavy equipment manufacturers, manufacturers of production facilities, engineering communities, government officials, and others must act and encourage the change from hard hats to helmets.

The undersigned do hereby state that henceforth their respective organizations will initiate and/or encourage open conversations relating to the change from hard hats to helmets in the Construction Industry and engage in responsible activities whose purpose is to strengthen the construction industry knowledge of TBIs and provide an optimal environment to encourage those decision makers in the construction industry to facilitate the change to helmets.
